Advanced

Update Method

Read Changes using Write-Ahead Log (CDC)

Recommended - Incrementally reads new inserts, updates, and deletes using the Postgres `write-ahead log (WAL)`. This needs to be configured on the source database itself. Recommended for tables of any size.

Detect Changes with Xmin System Column

Recommended - Incrementally reads new inserts and updates via Postgres `xmin system column`. Suitable for databases that have low transaction pressure.

Scan Changes with User Defined Cursor

Incrementally detects new inserts and updates using the `cursor column` chosen when configuring a connection (e.g. `created_at`, `updated_at`).

Fork in Builder

Copy JSON

Set up source

to new Postgres source.

To fill out the required information:

1. Enter the hostname, port number, and name for your Postgres database.

2. Optionally list the names of the schemas you want to sync tables from. These are case-sensitive. When not provided, all available schemas are discovered.

3. Enter the username and password you created in [Step 1](#).

4. Select an SSL mode. You will most frequently choose `require` or `verify-ca`. Both of these always require encryption. `verify-ca` also requires certificates from your Postgres database.

5. Select Standard (`xmin`) from available replication methods. This uses the `xmin system column` to reliably replicate data from your database.

1. If your database is particularly large (> 500 GB), you will benefit from [configuring your Postgres source using logical replication \(CDC\)](#).

Advanced Configuration using CDC

Airbyte uses [logical replication](#) of the Postgres write-ahead log (WAL) to incrementally capture deletes using a replication plugin:

• See [here](#) to learn more on how Airbyte implements CDC.

• See [here](#) to learn more about Postgres CDC requirements and limitations.

We recommend configuring your Postgres source with CDC when:

• You need a record of deletions.

• You have a very large database (500 GB or more).

• Your table has a primary key but doesn't have a reasonable cursor

Unpaused DAG data_pipeline_e2e.

Triggered data_pipeline_e2e, it should start any moment now.

Do not use SQLite as metadata DB in production – it should only be used for dev/testing. We recommend using Postgres or MySQL. [Click here](#) for more information.

Do not use the SequentialExecutor in production. [Click here](#) for more information.
